

Auto Prices

Through it, we define the automatic prices for the materials used in the program, for example: (last sale - last purchase of the last manufacturing cost).

To activate the automatic price action, the price required to be updated must be determined automatically after adding it from the card in the muniment properties (for example, with the characteristics of the sales invoice, we choose the last sale) so that the last sale price is updated with the material card automatically upon each price adjustment in the sales invoice.
